2021 Test Results

To whom it may concern:

In 2021, we purchased equipment to implement testing for every load of Non-GMO grain used in our feeds. This gives us the capability to determine if a grain is contaminated with GMO's within 10 minutes of sampling. Because of the large volume of tests being performed, we ask that you contact us to see our most recent test results. In prior years, a few samples were pulled from storage and sent off to a lab testing, while this gave us accurate results, we felt more frequent testing was needed.

It is our goal to grow quality Non-GMO grains while working to find methods of farming that improve the soil quality and the environment and can work on commercial size grain operations. All of this is in hope that we can show other farms that these practices can be practically integrated onto their farm. We cannot achieve this without the support of our customers. If there are any questions on our farming practices, please reach out as we want you to know what the story is behind our farm and our feeds. Thank you for your interest and your support of our products.

Sincerely,

Joshua Ernst
